## **Acknowledgements**

In my intriguing PhD journey, there are many people to whom I would be grateful forever. They have supported me to keep up my promises and always reminded me of how far I have come and how far I still want to go.

First, I would like to extend heartfelt gratitude to my primary supervisor, Professor Manohar Garg. From the time of my PhD application to date, the support you have provided to me is invaluable. Your ‘open door policy’ and endless availability has provided me with your insights and expertise. The countless times I had knocked your office door, you have always provided me the clarifications I needed without any sign of hesitation. Thank you for introducing me to the amazing ‘coffee’ that we get in Australia and the insightful discussions we have during our coffee breaks. One of your advices “take ownership of your project, learn as much as you can, celebrate every small achievement” had a great impact on me and will always remember this. It was an absolute pleasure and privilege to have you as my mentor, and I hope we can continue working together to create more innovative works like ‘InsuTAG’.

It was a wonderful opportunity to work with my co-supervisor, Dr Sham Acharya. I would like to thank you for providing the clinical insights into management and prevention of type 2 diabetes and for the opportunity to interact with many clinicians across general practises and John Hunter Hospital. I always learned new things form the discussion on our journeys to the presentation venues and other clinics. Despite of your busy schedule and clinical appointments, you have always provided me with time to meet whenever I required.

I would like to thank University of Newcastle and the Donor (Mr Eric Sansom) for providing me with financial support during my PhD candidature.

I am very grateful to Kylie Abbott, the super mum of three kids, for all the countless discussions during my PhD journey. Despite of the festival time and her other commitments, the amount of support she provided for the InsuTAG project was indispensable. We have co-authored 5 publications together and I hope we continue to work together to add more to our list.

To, Melissa Fry, Thank you for all your help and support. Particularly for all those early morning starts and for driving me around to the local hospitals. Thanks for being an amazing friend and coffee buddy.

Jessica Ferguson, it was great to share the office space with you and I thank you for being a great office buddy over the last couple of years. The surprise you had planned for my last birthday was one of the unforgettable moments of my life.

I would like to thank all the participants who participated in our clinical trials and in the Retirement Health and Lifestyle study for their support to the advancement of the scientific knowledge.

I would like to thank Mr Jeff Stormer, for his help and support with recruitment of trial participants. I also would like to thank Dr Cintia Dias for her assistance with statistical analysis in one of my trials and Mr Anu Alex for helping with methylation of samples for fatty acid analysis.

Following relocation from India, I have made good friends and that will continue into future, Ms Benjaporn Meeprom, Dr Raj Kumar Yadav, Assistant Professor Justin Francis Leon Nicolas, Mr Soobhiraj Bungraz and Dr Faizan Jameel, thank you all from the bottom of my heart for your support, professional and personal advices and friendship. Thanks for making my PhD journey a collection of wonderful life time memories with your company.

Finally, I would like to thank my dad, mom, brother and grandparents for encouraging me to pursue my dreams. Thank you for your emotional and financial support. I am hoping to see you soon to share this incredible journey to you in person.

7.5	Discussion.....	147
<b>CHAPTER 8 General Discussion .....</b>		<b>151</b>
8.1	Key findings.....	152
8.1.1	Novel marker, InsuTAG, shows superiority in identifying IR and MetS than the existing markers.....	152
8.1.2	Curcumin effectively lowered PBG levels, but did not show any effect on FPG and HbA1c.....	153
8.1.3	Curcumin effectively lowered both postprandial & fasting insulin levels and improved IS.....	154
8.1.4	Magnitude of reduction in blood lipids by curcumin was higher in individuals with T2D compared with the reductions in those with high risk of T2D.....	156
8.1.5	LCn-3PUFA lowers FPG in individuals with baseline FPG level above 5.5 mmol/L.....	157
8.1.6	LCn-3PUFA supplementation reduces erythrocyte arachidonic acid levels, but has no effect on CRP.....	157
8.1.7	Both LCn-3PUFA and curcumin exhibit similar magnitude of reduction in InsuTAG.....	158
8.1.8	Complementary or added benefits with curcumin and LCn-3PUFA were not observed in all the three intervention studies.....	160
8.2	Limitations .....	161
8.2.1	Feasibility of recruiting study participants with pre-diabetes and T2D .....	161
8.2.2	Heterogeneity in the study populations.....	161
8.2.3	Different available formulations of curcumin and fish oil.....	162
8.3	Conclusions.....	162
References.....		164

NLRP3	NOD, LRR and pyrin domain-containing 3 inflammasome
OGTT	Oral glucose tolerance test
PBF	Percent body fat
PBG	Postprandial blood glucose
PI	Postprandial insulin
PL	Double placebo
PPAR- $\alpha$	Peroxisome proliferator-activated receptor alpha sub unit
RHLS	Retirement Health and Lifestyle Study
ROS	Reactive oxygen species
SAE	Serious adverse event
SBP	Systolic blood pressure
SD	Standard deviation
SEM	Standard error of mean
SIRT1	Sirtuin1
SOSC3	Suppressor of cytokine signalling 3
STAT3	Signal transducer and activator of transcription 3
SREBP-1c	Sterol regulatory element-binding protein 1
T2D	Type 2 diabetes

TC	Total cholesterol
TG	Triglycerides
TLR4	Toll like receptor-4
TNF- $\alpha$	Tumor necrosis factor - alpha
UoNHREC	University of Newcastle Human Research Ethics Committee
UPR	Unfolded protein response
VLDL-C	Very low density lipoprotein cholesterol
WC	Waist circumference
WHR	Waist – hip ratio

## **Synopsis**

Type 2 diabetes (T2D) is the most common chronic metabolic disorder resulting from either deficit of insulin secretion and/or action. The transition of normal glucose tolerance to T2D is usually accompanied by a cluster of metabolic risk factors such as low-grade inflammation, oxidative stress, insulin resistance (IR) and dyslipidaemia. IR is one of the marked independent predictors among these cluster of metabolic abnormalities that mediates the transition in high risk states such as obesity, impaired glucose tolerance (IGT) and impaired fasting glucose (IFG) to overt T2D. IR also is often associated with decreased clearance of lipids and lipoprotein abnormalities, together representing a greater risk of cardiovascular disease (CVD) in both high risk and individuals with T2D. Several studies have employed lipid ratios, homeostatic models, and anthropometric measures as surrogate markers for predicting IR. However, none of these accounted for both insulin and lipid availability in a single model to predict IR or metabolic syndrome (MetS).

Therefore, the first aim of my PhD project, presented in the chapter 3, was to develop a novel marker for IR and MetS that accounts for both insulin and lipid availability in a single model. We proposed and evaluated a novel physiologically relevant marker, InsuTAG (product of fasting insulin and fasting triglycerides) as a predictor of IR and MetS. Cross-sectional analysis of data from the Retirement Health and Life-style Study (RHLS, n=618) showed that InsuTAG is a strong predictor of IR over existing lipid based surrogate markers and anthropometric measures. Receiver operating curve analysis indicated InsuTAG (93%) as the favourable marker for IR over other lipid based surrogate markers and anthropometry measures. Prevalence of MetS was significantly higher in individuals with InsuTAG values above the optimal cut-off value of 11.2. InsuTAG exhibited a greater area under than curve than HOMA-IR for identifying MetS. Together these observations indicate the potential of InsuTAG for predicting IR and MetS.

Despite effective lifestyle and pharmacological interventions, the prevalence of T2D is growing at an alarming rate in Australia, in line with global prevalence. Failure of long term compliance to these interventions is a major barrier for their effectiveness in halting the transition to T2D in high risk state individuals, indicating a necessity for alternative effective approach.

Given the fact that pathogenesis of T2D is chronic, complex and often involving multiple pathological pathways, use of well tolerated dietary bio-active compounds appears to be a potential strategy for delaying the onset of T2D. Several pre-clinical and *in-vitro* studies have reported the ability of dietary bio-actives to down regulate multiple pathological mechanisms (chronic low-grade inflammation, IR, oxidative stress and  $\beta$ -cell dysfunction) that are involved in the pathogenesis of T2D. We hypothesised that a combination of two lipid-lowering and anti-inflammatory dietary bio-active compounds, curcumin and long-chain omega-3 polyunsaturated fatty acids (LCn-3PUFA), could potentially act in multiple pathways to improve the glycaemic control in individuals at high risk of developing T2D.

My second aim, presented in chapter 4, was to evaluate the acute effects of curcumin and/or LCn-3PUFA on glycaemic responses. Therefore, in a randomised, cross over trial we investigated the postprandial glucose and insulin response to a single dose of curcumin and/or LCn-3PUFA in healthy individuals. The glucose levels were reduced by curcumin at as early as 30 min, and the maximum effect was observed at 60 min post meal consumption. Curcumin was found to be effective for lowering the insulin demand to control postprandial glucose levels. Similar results were observed following dietary supplementation with curcumin plus LCn-3PUFA. It was apparent that the postprandial effects on glycaemic control were primarily due to curcumin even in the combined treatment group. Thus, providing basis for long-term supplementation study with curcumin for glycaemic control.

In chapter 5, a detailed study protocol for 2x2 factorial placebo controlled, double blinded randomised trial with long term (12 weeks) curcumin and LCn-3PUFA supplementation (COP-D trial) was presented. In chapter 6, we examined the effects of curcumin with or without LCn-3PUFA on glycaemic control and blood lipid levels in people at high risk of T2D. 12 weeks of supplementation with curcumin has effectively reduced the fasting insulin levels and IR in individuals with high risk of T2D. Parallel to these results, both curcumin and LCn-3PUFA were able to reduce the fasting triglycerides and atherogenic index of plasma, however the magnitude of reduction was greater with LCn-3PUFA supplementation. InsuTAG levels were also reduced with curcumin and LCn-3PUFA supplementation. However, this study failed to show any complimentary effects with concurrent administration of curcumin and LCn-3PUFA. Though IR and fasting triglycerides, were effectively reduced by these two bio-actives, we did not find any

beneficial effects of curcumin and LCn-3PUFA supplementation on fasting glucose and glycosylated haemoglobin levels.

In chapter 7, we designed a study to target commonly prevalent dyslipidaemia with curcumin and/or LCn-3PUFA in individuals with T2D (CALFOR-CVD trial). Participants were randomised to either placebo or curcumin or LCn-3PUFA, or curcumin plus LCn-3PUFA for six weeks. This pilot study has demonstrated that supplementation of curcumin can effectively reduce the TG. Contrasting to the results from chapter 6, magnitude of reduction in triglycerides in this study was higher with curcumin than LCn-3PUFA. Preliminary observations also presented a non-significant, but a noteworthy reduction of 0.5 mmol/L in total cholesterol and LDL-Cholesterol with curcumin supplementation. In line with observations from the COP-D trial, curcumin and LCn-3PUFA did not have any complimentary and/or added benefits.

In conclusion, the results presented in this thesis demonstrate that InsuTAG has the potential to predict IR and MetS. This provides a basis for further research to validate InsuTAG with gold standard technique for IR and a longitudinal data analysis to determine the ability of InsuTAG to predict T2D in general population. With regards to the intervention trials, our hypothesis of targeting multiple pathways (IR and dyslipidaemia) in high risk and T2D patients with curcumin and LCn-3PUFA supplementation was successful. However, this thesis failed to provide any evidence on beneficial effects of combining curcumin and LCn-3PUFA for better glycaemic control to delay the onset of T2D. This could partly be due to presence of any unknown interactions between the two bio-actives or may be due to uncertainties in co-administration of curcumin and LCn-3PUFA. Thus, paving a way for further research to investigate beneficial effects with single formulation (curcumin and LCn-3PUFA) for achieving glycaemic control. This thesis constitutes a noted contribution to the research area of biomarkers and novel intervention strategies for T2D, and also presents a set of riddles that provides an extensive scope for future research.

## **Thesis layout**

This thesis by publication is presented as 7 chapters: general introduction and literature review, general methodology chapter, 2 papers published in peer reviewed journals, 2 papers submitted for publication (under review), and one is presented as an unpublished chapter.

### **❖ Chapter 1- General introduction and literature review**

This chapter describes prevalence, economic and health burden of T2D, prediabetes and pathological mechanisms involved in the progression of prediabetes state to overt T2D. This chapter also focuses on the role of bio-active compounds for prevention or delaying the onset of T2D.

### **❖ Chapter 2 – General methodology**

This chapter describes detailed methodology, trial design and statistical analysis employed in the clinical trials (Chapter 4, 6 and 7).

### **❖ Chapter 3 – InsuTAG: A novel and physiologically relevant marker of insulin resistance and metabolic syndrome.**

This chapter is presented as published paper “Thota RN, Abbott KA, Ferguson JJA, Veysey M, Lucock M, Niblett S, King K, Garg ML. InsuTAG: A novel physiologically relevant predictor for insulin resistance and metabolic syndrome. *Scientific Reports*. 2017; 7(1):15204.” The paper presents necessity for developing a novel marker, cross sectional study methodology, statistical analysis, results and discussion on whether InsuTAG has the potential to identify insulin resistance and metabolic syndrome.

### **❖ Chapter 4 – Curcumin alleviates postprandial glycaemic response in healthy subjects: A cross over, randomised controlled study.**

This chapter is presented as a paper (submitted MAR 18). It describes the study aims, design, methods, results and discussion on the effects of curcumin and omega-3 fatty acids for controlling the post-prandial glucose responses to a standardised high carbohydrate-fat meal in healthy adults.

### **❖ Chapter 5 – Curcumin and long-chain Omega-3 fatty acids for Prevention of type 2 diabetes (COP-D): study protocol for a randomised controlled trial.**

This chapter is presented as a published paper ‘Thota RN, Acharya SH, Abbott KA, Garg ML. Curcumin and long-chain Omega-3 polyunsaturated fatty acids for Prevention of type 2 Diabetes (COP-D): study protocol for a randomised controlled

trial. *Trials*. 2016; 17:565'. This chapter presents the detailed study protocol of COP-D trial and provides a rationale for conducting a clinical trial with curcumin and LCn-3PUFA for controlling risk factors associated with progression of T2D.

❖ **Chapter 6– Effects of curcumin and/or omega-3 polyunsaturated fatty acids on glycaemic control and blood lipids in individuals with high risk of T2D: A randomised controlled trial.**

This chapter is presented as a submitted version ‘ Thota RN, Acharya SH, Garg ML. Effects of curcumin and/or omega-3 polyunsaturated fatty acids on glycaemic control and blood lipids in individuals with high risk of type 2 diabetes: A randomised controlled trial. (Manuscript submitted MAR 18). This chapter describes the aims, methods, results and discussion from COP-D trial.

❖ **Chapter 7 – Curcumin and/or omega-3 polyunsaturated fatty acids for amelioration of diabetic dyslipidaemia: a pilot randomised controlled trial**

This chapter presents the study aims, design, methods and results from pilot randomised controlled trial, ‘Curcumin And Long-chain omega-3 polyunsaturated fatty acids **FOR** management of CardioVascular health in individuals with type 2 Diabetes (CALFOR-CVD trial).

❖ **Chapter 8 – General discussion**

This chapter focuses on discussion on overall results from the clinical trials, strengths and limitations of the respective trials, significance of this research in nutrition and diabetes research areas and future directions.
